Energy Systems Integration Group
2019 Fall Technical Workshop

Opening Plenary Session:
Considerations for the System of the Future

T. BRUCE TSUCHIDA

October 29, 2019
Agenda

Past: Renewables have been growing
- Favorable policies and cost reduction
- Industry evolution
- Diversified off-takers

Future: Renewables will likely continue to grow
- Various de-carbonization regulations and aspirations
- Plausible realization via clean electricity and deep electrification
- Impacts the shape and form of energy markets (and transactions)

Implications of impacts on asset values, contract design, and performance
Past: Renewables have been growing

**Favorable Policies and Markets**

### Policy Incentives:
- Renewable Portfolio Standards (RPS).
- Tax Credits (Federal, State etc).
- Renewable Energy Credits.
- Other various rebates and incentives from utilities and governments.

### Market Forces:
- Dropping costs of renewables (~80% for solar PV installations, and ~40% for onshore wind over the past five years).
- Lower energy costs (partially driven by lower natural gas prices) and competition leading to lower PPAs.
Past: Renewables have been growing
Favorable Policies - RPS

While most RPS are at least ten years old, they are constantly being revised—oftentimes with upwards targets.

Past: Renewables have been growing
Various Non-Utility Off-takers

Non-utility off-taker examples:
- Google, Facebook, Apple, Microsoft, Amazon, AT&T, 3M, General Motors, Royal Dutch Shell, Exxon Mobile, Walmart, Various Academic Institutes, etc.

In 2018 alone, more than six GW of power purchase agreements (PPAs) were inked by private industry.

Source for figure and table: Analysis of Commercial and Industrial Wind Energy Demand in the United States, Wood Mackenzie, August 2019

For Discussion Purposes
Renewables (largely wind and solar) have been growing significantly.

Past: Renewables have been growing

Review of the Last 20 Years

ESIG Trivia (Industry Evolution)

  “What is wind?”

- 2006: Utility Wind Integration Group (80 members).
  “Can we integrate 10% wind? What about 20%?”

  “We can get 30% wind, what about solar?”

Source: U.S. Renewable Portfolio Standards, 2018 Annual Status Report, Lawrence Berkeley National Laboratory, November 2018

For Discussion Purposes
Future: Renewables will likely continue to grow
Still Favorable Policy Outlooks

RPS goals

- States have generally met their interim RPS targets in recent years, with only a few exceptions reflecting unique, state-specific policy designs.

- Meeting future RPS demand growth requires:
  - Reach 15% of electricity sales by 2030 (compared to ~11% today).
  - Roughly a 50% increase in renewable generation by 2030 (~56 GW of new renewables capacity).

De-carbonization goals

- Several states and cities have introduced de-carbonization goals (e.g., 80% reduction from 1990 level by 2050).

- The Green New Deal calls for net-zero global emissions by 2050 and an interim target of curbing emissions from 2010 levels by 40% to 60% by 2030.

- Several utilities have committed to de-carbonization goals.
  - National Grid, AEP, Duke, NRG, DTE, etc.

- Private businesses have also committed to de-carbonization goals.
  - AstraZeneca: 16,000 EVs by 2030, Ingka Group (IKEA): 100% RE offset, Novo Nordisk (healthcare): 100% RE at all sites by 2020, Amazon (100% net zero by 2050), Nokia Corp.: realign emissions targets to 1.5 degrees-C global warming target of the Paris Accord, etc.
Future: Renewables will likely continue to grow

Clean Energy and De-carbonization

States with Clean Energy Goals/Commitments

- **California**: State-wide goal of 100% renewable electricity by 2045.
- **Hawaii**: State-wide goal of 100% renewable electricity by 2045.
- **Maine**: State-wide commitment of 80% renewable energy by 2030 and 100% by 2050.
- **Nevada**: Goal of 50% renewable electricity statewide by 2030, and 100% clean energy by 2050.
- **New Mexico**: Requires electricity generation in the state to be 80% renewable by 2040, and 100% carbon-free by 2045.
- **New York**: Mandates New York reduce 85% greenhouse gas emissions economy-wide by 2050; sources 70% of electricity from renewables by 2030 and achieves a 100% carbon-free electric sector by 2040.
- **Washington D.C.**: Committed to achieve 100% clean, renewable electricity supply across the district by 2032.
- **Washington**: Mandates an equitable transition to 100% clean electricity generation for the entire state by 2045.
- **Puerto Rico**: Established a territory-wide goal of 100% clean, renewable electricity by 2050.
Future: Renewables will likely continue to grow

Clean Energy and De-carbonization

Cities with active de-carbonization commitments

Source: https://www.c40.org/case_studies

There are over 100 cities in the US with similar commitments:

- Amherst MA, Atlanta GA, Boulder CO, Cambridge MA, Chicago IL, Cleveland OH, Cincinnati OH, Columbia SC, Concord NH, Denton TX, Denver CO, Fort Collins CO, Gainesville FL, Golden CO, Hannover NH, Hillsborough NC, Kansas City MO, Madison WI, Minneapolis MN, New Brunswick NJ, Orlando FL, Palo Alto CA, Park City UT, Philadelphia PA, Salt Lake City UT, San Francisco CA, San Diego CA, San Jose CA, Santa Barbara CA, Santa Monica CA, Spokane WA, St Louis MO, St Paul MN, Tallahassee FL, Traverse City MI, Town of Truckee CA, West Hollywood CA and more......
Future: Renewables will likely continue to grow

Clean Energy and De-carbonization

What does it look like?

- De-carbonization will likely induce huge load growth associated with electrification of load and increase in electric vehicles (unless other industry sectors figure out de-carbonization approaches outside of electrification).

Clean Energy and De-carbonization

What does it look like?

- The increased load will be served largely by renewable resources (that have lower capacity values), requiring significant investments.

Future: Renewables will likely continue to grow

Impact on Electricity Markets

In Ontario, the power system is already at a 90% clean energy fleet—with dramatic consequences for power market prices.

Energy prices have fallen 79% with low gas prices and de-carbonization

Source: [http://www.ieso.ca/en/Corporate-IESO/Media/Year-End-Data](http://www.ieso.ca/en/Corporate-IESO/Media/Year-End-Data)
Future: Renewables will likely continue to grow

Impact on Operations

Load profiles (with electrification) are unlikely to coincide with renewable generation output, creating a huge ramping and load balancing problem (in the order of 1,000s of MW) requiring storage, load control and DR, or overbuilding (then curtailing) renewables. Renewables and storage complement and compete at the same time.

Seasonality and “extreme days” will be important considerations:

- Meeting protracted low-RE generation days (more likely in winter peak days with lower solar output) requires overbuild.
- Lower solar output indicates the need for more wind and storage during cold weather peak days.
Future: Renewables will likely continue to grow

Impact on Utilities’ Financing

Potential Impact on Rates: City of Los Angeles Example

- Investment needs to reach 100% clean can be in the $70 billion range.
- The large investment (or contracts associated) could be seen as higher financial risks and impact credit ratings.
- Change in credit ratings by two notches could impact retail rates by 4 cents per kWh (roughly 20% if you assume the average residential rate to be about 20 cents/kWh)
- This impact is in addition to the rate increase associated with the new investments.

Future: Renewables will likely continue to grow
And the Ripple Effect on Rates

Inner-workings within a utility (illustrative example for a mid-sized US utility)

- Increasing PV capacity factor by 2% from 14% to 16% leads to a drop in PV LCOE and shorter payback period. This encourages more customers to adopt PV. The combined effect is the increase in rates (higher solar adoption leads to more revenue shortfall).
- Offsetting this impact through rate adjustments would require the rate shift from 90/10 variables/fixed rate to 75/25 variable/fixed rate over a 10 year span.
Future: Renewables will likely continue to grow
What does this mean for Renewables?

Considerations for future renewables

- **De-carbonization and clean energy goals are policy driven, rather than market driven**
  - Most de-carbonization policies aim at de-carbonizing the electric industry and then electrifying other industries (heating, transportation etc).
  - Regulatory authorities may use utilities as a contracting vehicle or create a centralized buyer (e.g., NYSERDA).

- **Energy market implications**
  - Increased renewables will lower energy prices, which helps incentivize load electrification.
  - Contracts may be more towards capacity than energy.
  - PPAs based on $/MWh sales may no longer be appropriate under such future world.
  - Storage and DR, which are often thought of as means to complement renewables today, could become a competitor.

- **Contracting Partner (Utility)**
  - Large investments (or contracts) needed by utilities could impact their ratings.
  - Lower ratings -> higher cost of capital -> higher rates.
  - Increased adoption of DERs could also impact rates.
  - Regulators want to avoid rate increases.
Future: Renewables will likely continue to grow
What should we do?
The Brattle Group provides consulting and expert testimony in economics, finance, and regulation to corporations, law firms, and governments around the world. We aim for the highest level of client service and quality in our industry.

**OUR SERVICES**
- Research and Consulting
- Litigation Support
- Expert Testimony

**OUR PEOPLE**
- Renowned Experts
- Global Teams
- Intellectual Rigor

**OUR INSIGHTS**
- Thoughtful Analysis
- Exceptional Quality
- Clear Communication
Our Practices and Industries

**ENERGY & UTILITIES**
- Competition & Market Manipulation
- Distributed Energy Resources
- Electric Transmission
- Electricity Market Modeling & Resource Planning
- Electrification & Growth Opportunities
- Energy Litigation
- Energy Storage
- Environmental Policy, Planning and Compliance
- Finance and Ratemaking
- Gas/Electric Coordination
- Market Design
- Natural Gas & Petroleum
- Nuclear
- Renewable & Alternative Energy

**LITIGATION**
- Accounting
- Analysis of Market Manipulation
- Antitrust/Competition
- Bankruptcy & Restructuring
- Big Data & Document Analytics
- Commercial Damages
- Environmental Litigation & Regulation
- Intellectual Property
- International Arbitration
- International Trade
- Labor & Employment
- Mergers & Acquisitions
- Litigation
- Product Liability
- Securities & Finance
- Tax Controversy & Transfer Pricing
- Valuation
- White Collar Investigations & Litigation

**INDUSTRIES**
- Electric Power
- Financial Institutions
- Infrastructure
- Natural Gas & Petroleum
- Pharmaceuticals & Medical Devices
- Telecommunications, Internet, and Media
- Transportation
- Water
