April 20, 2020
By 2025, 10 million customers in California will be on default TOU rates

Currently, there are some 2.2 million customers on TOU rates

On an opt-out basis, SMUD has 542,000, SDGE has 670,000

On opt-in basis, PG&E has 515,000 customers on TOU rates, SCE has 500,000 customers

Starting in October 2020, the latter two utilities will place all new connections on TOU rates; the transition of all customers to opt-out TOU rates should be completed by 2025
California’s transition to opt-out TOU rates will lay the groundwork for dynamic pricing

TOU rates promote economic efficiency and equity between customers; they have gained widespread acceptance by numerous stakeholders in the state

TOU rates incentivize smart charging of EVs and make the best use of PVs with battery storage

They lay the foundation for technology-enabled dynamic pricing

There are six reasons for the state to begin planning the next step in pricing reform
Reason1: California suffered a major energy crisis in 2000-01

One of the major reasons for the debacle was the absence of price-responsive demand, which disconnected retail from wholesale markets.

A group of economists (including xxx, and me) signed a manifesto calling for the introduction of dynamic pricing in the state.

The CPUC initiated a docket on dynamic pricing, demand response and smart metering under the leadership of Mike Peevey.
Reason 2: Californians understand and respond to dynamic pricing

A Statewide Pricing Pilot, jointly conducted by a stakeholder group under the sponsorship of the CPUC and the CEC, ran over a two-year period.

It provided conclusive evidence that Californians accepted and responded to dynamic pricing.

Using the results of the pilot, the three investor-owned utilities filed business cases for AMI involving some $5 billion and all were approved.
Reason 3: California is the Innovation Capital of the world

World class companies like Apple, Cisco, Facebook, Google, LinkedIn, Tesla and Twitter are located in the state.

Just about everything new and exciting begins in California and then it sweeps the nation and eventually encompasses the entire globe.

California, with ~15% of the nation’s GDP, has a “golden” opportunity to serve as a role model in the pricing of electricity for the rest of the nation.
Reason 4: Californians have already encountered dynamic pricing

<table>
<thead>
<tr>
<th>ACTIVITY</th>
<th>EXAMPLES</th>
</tr>
</thead>
<tbody>
<tr>
<td>Driving their car</td>
<td>Toll bridges, roads, parking meters</td>
</tr>
<tr>
<td>Entertainment</td>
<td>Movies, operas, plays, happy hour at restaurants</td>
</tr>
<tr>
<td>Ride sharing</td>
<td>Uber, Lyft, Kareem</td>
</tr>
<tr>
<td>Sporting events</td>
<td>Baseball, basketball, football</td>
</tr>
<tr>
<td>Vacation and business travel</td>
<td>Airlines, hotels, car rentals</td>
</tr>
</tbody>
</table>
Reason 5: Enabling technologies are widely deployed in the state

Enabling technologies such as smart, WiFi thermostats and digital appliances are widespread in the state, as are energy efficient LEDs and appliances, many of which are digital.

PVs, Battery Storage and EVs are being adopted at a rapid clip, showing that customers are keen to manage their energy lifestyle.

New homes will have solar built into their roofs and many will become zero energy homes.
Reason 6: By 2045, the grid will be 100% carbon free

California’s grid will face reliability challenges stemming from the heavy dependence on intermittent renewable energy sources.

Load flexibility will be needed to maintain system reliability at least cost.

One of the best ways to promote load flexibility is to deploy dynamic pricing as a default tariff by 2030.
Conclusion

The state should begin offering dynamic pricing as an opt-in tariff in 2025 when default TOU deployment has been completed.

It should gain experience and insights during the next five and prepare Californians for the advent of a new era in 2030.

In that year, dynamic pricing, integrated with enabling technologies, should be made the default tariff in the state.

References (concluded)

Ahmad Faruqui is an internationally recognized authority on the design, evaluation and benchmarking of tariffs. He has analyzed the efficacy of tariffs featuring fixed charges, demand charges, time-varying rates, inclining block structures, and guaranteed bills. He has also designed experiments to model the impact of these tariffs and organized focus groups to study customer acceptance. Besides tariffs, his areas of expertise include demand response, energy efficiency, distributed energy resources, advanced metering infrastructure, plug-in electric vehicles, energy storage, inter-fuel substitution, combined heat and power, microgrids, and demand forecasting. He has worked for nearly 150 clients on 5 continents, including electric and gas utilities, state and federal commissions, governments, independent system operators, trade associations, research institutes, and manufacturers.

Ahmad has testified or appeared before commissions in Alberta (Canada), Arizona, Arkansas, California, Colorado, Connecticut, Delaware, the District of Columbia, FERC, Illinois, Indiana, Kansas, Maryland, Minnesota, Nevada, Ohio, Oklahoma, Ontario (Canada), Pennsylvania, Saudi Arabia, and Texas. He has presented to governments in Australia, Egypt, Ireland, the Philippines, Thailand, New Zealand and the United Kingdom and given seminars on all 6 continents. He has also given lectures at Carnegie Mellon University, Harvard, Northwestern, Stanford, University of California at Berkeley, and University of California at Davis and taught economics at San Jose State, the University of California at Davis, and the University of Karachi.

His research been cited in Business Week, The Economist, Forbes, National Geographic, The New York Times, San Francisco Chronicle, San Jose Mercury News, Wall Street Journal and USA Today. He has appeared on Fox Business News, National Public Radio and Voice of America. He is the author, co-author or editor of 4 books and more than 150 articles, papers and reports on energy matters. He has published in peer-reviewed journals such as Energy Economics, Energy Journal, Energy Efficiency, Energy Policy, Journal of Regulatory Economics and Utilities Policy and trade journals such as The Electricity Journal and the Public Utilities Fortnightly. He is a member of the editorial board of The Electricity Journal. He holds BA and MA degrees from the University of Karachi, both with the highest honors, and an MA in agricultural economics and a PhD in economics from The University of California at Davis, where he was a research fellow.
